

INDEPENDENT VERIFICATION STATEMENT

Annual Greenhouse Gas Emissions Report, Reporting Year 2025

Statement reference	KVS-25-117
Date of statement	24 March 2026
Operator	Dunes Energy Company
Facility	Southern Dunes Field Central Processing Facility 2 (CPF-2) (EAD ID AD-OG-0417)
Reporting period	1 January to 31 December 2025
Emissions report	DEC-SDF-CPF2_EAD-MRV-Emissions-Report_RY2025.xlsx (final)
Monitoring Plan	DEC-SDF-CPF2-HSE-MP-001 Rev 3.0
Criteria	EAD Technical Guidance for MRV; approved Monitoring Plan; ISO 14064-3:2019
Level of assurance / materiality	Reasonable assurance / 5% of total reported emissions
Verification team	Daniel Okafor (Lead Verifier); Arjun Menon, CEng (Technical Expert, oil & gas); Sophie Laurent (Independent Reviewer)
Notification to EAD / site visit	26 June 2025 / 12 November 2025

1. Scope

CO₂ emissions from source streams SS-01 to SS-04, and CH₄ from combustion and flare combustion slip (M-01 to M-03). Methane sources M-04 to M-08 (storage tanks, TEG still vent, pneumatic controllers, compressor seals and fugitive components) are not quantified in the Monitoring Plan and were excluded from the scope of this verification at the request of the operator.

2. Emissions covered by this statement

ID	Source	Verified (t CO ₂ unless stated)
SS-01	Fuel gas	201,152
SS-02	HP flare gas	53,680
SS-03	LP flare gas	8,144
SS-04	Diesel	4,520
CH ₄	Methane (in scope)	264.3 t CH ₄ = 7,400 t CO ₂ e
Total verified emissions		274,896 t CO ₂ e

3. Verification activities

- Remote review of the Monitoring Plan, GHG workbook and previous correspondence with the Agency; strategic analysis and risk assessment.
- Site visit on 12 November 2025: interviews with the GHG & Energy Lead, Instrumentation Supervisor, Laboratory Coordinator and Production Accounting Engineer; inspection of FT-3001, FT-5101 and FT-5102.
- Data testing: PI historian totals traced to the GHG workbook for 3 months per source stream; recalculation of all source streams; sampling of 60% of diesel invoices.

- Cross-checks of meter totals against the production allocation gas balance; review of calibration certificates and gas analyses.

4. Findings

ID	Classification	Description	Status
F-01	Misstatement, uncorrected	SS-01: the IPCC default emission factor (56.10 t CO ₂ /TJ) was applied instead of the site-specific factor required by Monitoring Plan section 5.2 (mean of quarterly analyses 56.96 t CO ₂ /TJ). Understatement 3,084 t CO ₂ (1.1% of total), below materiality.	Open. Operator to correct from RY2026.
F-02	Misstatement, corrected	SS-04: one diesel delivery was counted twice in the draft report (+62.4 t diesel). Corrected in the final report.	Closed
F-03	Non-conformity, unresolved	SS-02: the calibration of HP flare meter FT-5101 expired on 31 May 2025 and the meter was removed on 1 June 2025 and not reinstated during the reporting period. HP flare volumes from 1 June to 31 December 2025 (6,752,500 Sm ³ , 31% of SS-02) are engineering estimates. Documentation of the estimation model was not provided and the estimates could not be corroborated against the gas balance. The substitution procedure of Monitoring Plan section 8.3 was not applied and the plan was not revised.	Open
F-04	Observation	Methane sources M-04 to M-08 are not quantified (Monitoring Plan section 6.3). Quantification is required for a complete report.	Open

5. Opinion

Qualified opinion. Based on the procedures performed and the evidence obtained, except for the possible effects of the matter described in finding F-03, the in-scope CO₂ and CH₄ emissions stated in the operator's emissions report for the period 1 January to 31 December 2025 are, in all material respects, fairly stated in accordance with the verification criteria.

Basis for qualification. HP flare volumes for 1 June to 31 December 2025 are based on uncorroborated engineering estimates. We were unable to obtain sufficient appropriate evidence for source stream SS-02 for that period. This statement does not cover methane sources M-04 to M-08.

6. Recommendations

1. Reinstall and recalibrate FT-5101; apply the Monitoring Plan substitution procedure and report the June to December 2025 period as a data gap.
2. Revise the Monitoring Plan to include quantification of all methane sources before RY2026.
3. Apply the site-specific fuel gas emission factor as required by the Monitoring Plan.

This statement is issued to Dunes Energy Company for submission to the Environment Agency – Abu Dhabi and relates only to the facility and period stated. The operator is responsible for the preparation of the emissions report.
